

Proof Of Experiment

Sysbench 4.1 :

- Check for any current processes by executing “top -i” & make sure no other tasks are running in qemu and container
- Execute the bash script created to get the results
- Check the memory during each execution for user-level and kernel -level usage.

TEST 1 :sysbench --test=cpu --cpu-max-prime=20000 run

Ubuntu :

The screenshot shows a terminal window titled "pragya@pragya-Virtual-Machine: ~". The terminal output displays the results of a sysbench CPU test. It starts with "Initializing worker threads..." and "Threads started!". The CPU speed is reported as 1057.67 events per second. General statistics show a total time of 10.0004s and a total number of events of 10579. Latency statistics include min (0.76), avg (0.94), max (6.39), 95th percentile (1.16), and sum (9990.75). Thread fairness statistics show events (avg/stddev) as 10579.0000/0.00 and execution time (avg/stddev) as 9.9907/0.00. The prompt "pragya@pragya-Virtual-Machine:~\$" is visible at the bottom.

```
pragya@pragya-Virtual-Machine: ~
Initializing worker threads...
Threads started!

CPU speed:
  events per second: 1057.67

General statistics:
  total time:          10.0004s
  total number of events: 10579

Latency (ms):
  min:                 0.76
  avg:                 0.94
  max:                 6.39
  95th percentile:    1.16
  sum:                 9990.75

Threads fairness:
  events (avg/stddev): 10579.0000/0.00
  execution time (avg/stddev): 9.9907/0.00

pragya@pragya-Virtual-Machine:~$
```
